LightsOut — Unity Diagnostic Package

Project brief

LightsOut is a compact Unity diagnostic project preserved as a package, with a separate demonstration link. Its button and game-manager scripts can be reviewed as small implementation samples. The combination of source, demo and task-board reference gives more context than a screenshot alone. It is a supporting example of implementing interactions, tracking game state and communicating a small project’s behavior.

Ownership

Unity coursework implementer

Evidence focus

Compare the LODiagnosticButton and LODiagnosticGameManager source with the demonstration. Confirm that a newly imported version reproduces the intended behavior before distributing a build.

Scope

The package was not launch-tested here. The video is a preserved external reference, not a new test or a guarantee of current anonymous access.

Skills

Puzzle-state logic, input handling, diagnostics, communication
