Pong — Unity Project

Project brief

This Unity archive preserves a Pong implementation with scenes, ball and paddle scripts and a build directory. Selected C# scripts were inspected to identify the ball, paddle and goal-handling responsibilities. The project is a supporting example of turning a recognizable gameplay loop into engine behavior. It gives a concrete starting point for discussing motion, collision, scoring and how game objects work together.

Ownership

Unity coursework implementer

Evidence focus

The source inspection identifies Ball, Paddle and goal-handling scripts. Review the actual implementation before making claims about a modern rebuilt version.

Scope

The archive was inspected but not imported or launch-tested in a current editor. A build directory does not establish that an executable still runs, and archived engine/template assets are not all original authorship.

Skills

Core game behavior, scripting, project structure, implementation foundations
