Airron Kennedy — Game Designer

Role profile · draft

Systems-focused design, tabletop balancing, Unreal prototyping and evidence-led iteration.

Selected project evidence

Revived by Ally — Solo designer. I designed a two-player race around dice and tactical action pieces: Block, Space Swap, Double Roll and Trap. The final rules and weekly journal show how those options changed through playtesting, rather than presenting the finished rules without their history. Early effects allowed repeated turn-skipping, so I revised piece effects and limits to keep both players participating. This is a compact example of balancing a competitive system around player agency and pacing.

Collection Revenge — Solo prototype designer and playtest author. I used a turn-based physical prototype to investigate choices intended for an FPS/MOBA concept. Eight documented playtest rounds explore map perspective, route selection, HP, battle randomness, recovery, Leech Life, rerolls and enemy timing. The observations show both productive changes and new problems: randomness could create frustration, while recovery and rerolls changed the player’s sense of control. The final document compares original and revised rules and reflects on the limits of translating real-time decisions into turn-based play.

Arena Battler — Time as Currency — Concept, pitch and Blueprint contribution within a team prototype. Arena Battler is a rogue-like arena FPS prototype built to explore time as a resource. Across a proposed five-round enemy structure, players earn currency and choose between spending it on upgrades or saving it for more time. My individual contribution log records the high concept, prototype pitch, Blueprint scripting, mechanic iterations, research questions, gameplay flowchart and weekly presentations. The team postmortem adds a second perspective on balancing choices and working within production constraints.

Skills evidence

Systems design, balancing, rules writing, playtesting, Experimental prototyping, risk analysis, player choice, iteration, System economies, prototyping, mechanic iteration, collaboration

Education context

Full Sail University — Game Design coursework and applied-thesis artifacts through May 2023. Exact awarded-degree wording and current employment history should be confirmed before applying.

Review boundary

New project-focused draft, not an approved final application resume. Employment chronology is intentionally omitted pending verification. No historical private resume content is included. Software work is AI-assisted; team artifacts are credited as team work.
