Robo-Intero Postmortem Airron Kennedy

Introduction:

Robo-Intero was created by a group of individuals, including an artist, three skilled programmers, and a level designer. Together, our team was able to bring their unique talents and perspectives to develop a game that challenges players to navigate complex moral and ethical dilemmas in a high-pressure environment. Thanks to our collaborative and innovative development process, we were able to create a game that is both engaging and thought-provoking.

Pros:

Developing Robo-Intero whiles using the popular game "Papers Please" as a premise with a group of 5 students brought about several advantages to the development process. Firstly, it allowed for collaboration in that each member could learn from one another's strengths and weaknesses, resulting in a more well-rounded project, This was ultimately one of the first things we established to understand each team member's individual skills. Secondly, members of our group were really effective in communication via discord and would frequently mark meetings and get everyone on track with our milestone goals, resulting in a more adaptable development process. Finally, by dividing tasks and managing time efficiently, the team was able to complete the project within the given timeframe, without compromising too much on quality. The team was able to leverage these advantages to deliver a product with an interesting premise.

Cons:

While developing Robo-Intero, the team was presented with several advantages, but there were also some challenges that the team faced. Firstly, communication between team members could have been better, as there were multiple perspectives and ideas when it came down to designing mechanics. This led to misunderstandings that impacted the project's timeline. Secondly, the small team size was difficult to navigate when only a couple of members fully understood the premise game “Papers please”, potentially leading to a less creative and innovative project. Lastly, dividing tasks and responsibilities may have led to some team members feeling overwhelmed or overburdened with their responsibilities, leading to burnout and lower quality work. Overall, while the team was able to leverage its advantages to deliver a high-quality product, it also faced several challenges that it had to navigate to achieve success.

Reflections:

Developing Robo-Intero presented both advantages and challenges that can inform future development efforts. To address communication challenges, future development efforts should establish clear communication techniques and processes such as regular check-ins on discord, and feedback sessions to ensure everyone is aligned. To help with innovation and prevent limitations of ideas, future development efforts should embrace differences and encourage collaboration across the team. Finally, to address the challenge of workload imbalance, future development efforts should prioritize team member well-being by setting clear expectations, deadlines, and providing resources and support when needed. By implementing these reflections, future development efforts can be more effective and successful.
