Team Pain — Research and Feature Communication

Project brief

The recovered Team Pain submissions preserve references to a competitive-analysis presentation, a research presentation and two feature specifications. They show the communication side of a team project: explaining comparisons and organizing a feature discussion for other people. The small original text files are pointers to external evidence, not full offline project backups. I include their links with clear access and contribution boundaries so reviewers know what they are opening.

Ownership

Coursework team contributor

Evidence focus

Open the original presentation or specification and identify a concrete feature or comparison before using it in an interview. The portfolio links preserve where the evidence lives without pretending every document was duplicated.

Scope

Later Perforce-only builds were not recovered. External-document access can change, and individual authorship should be checked in the team artifacts.

Skills

Comparative research, feature communication, presentations, collaboration
