AirronKennedy.com — Website and GitHub

Project brief

My website organizes a personal web presence as worlds in a space-themed navigation system, with Work Planet as the professional portfolio destination. The public frontend uses HTML, CSS and JavaScript, with distinct mobile and desktop planet layouts, accessible names and reduced-motion handling. The matching public GitHub repository makes the site’s structure inspectable. The portfolio expansion connects those project cards to a deeper library of case studies, original files and source samples without replacing the visual identity.

Ownership

Personal portfolio; current public source verified

Evidence focus

Explore the route from the space homepage into Work Planet, then follow a project card to its supporting artifact. Source snapshots are point-in-time evidence, not a full repository backup.

Scope

One public website repository was verified; private repositories were not inspected. Normal HTTPS currently succeeded, so the historical certificate issue was not reproduced, and no full accessibility audit is claimed.

Skills

Responsive navigation, visual theming, accessible labels, progressive interaction
